

Summary Post

Introduction

In my initial post I discussed how the CUE model could be adapted to emphasis the change in human emotion over time. Using the experiment by Michael Minge and Manfred Thüring on Hedonic and pragmatic halo effects at early stages of User Experience as a starting point.

After contributing to other students' initial posts, I am still of the belief the CUE model is flawed as despite its usefulness it has many limitations.

Feedback from your peers

Unfortunately, on the second collaborative discussion I received no feedback from any of my peers. This is not ideal as part of your summary post requires feedback from your peers. This is the first time during my postgraduate studies that a collaborative discussion has received so few responses.

Conclusion

As I didn't receive any feedback from my peers there wasn't much value I gained from the second collaborative discussion. I hope this is not going to happen again in future modules as it significantly limits my learning. I would have expected a higher standard from postgraduate students. Due to not receiving any responses from my peers I had to read though my peer's initial posts. I gained the most insights from Andrius's post as he provided first-hand knowledge gained from his 10 years' experience working in UX.
